

# IPv4 Address Exhaustion: A Progress Report

Geoff Huston

Chief Scientist, APNIC

Olaf Kolkman

NLnet Labs

The mainstream  
telecommunications  
industry has a  
rich history

The mainstream  
telecommunications  
industry has a  
rich history

...of making very poor  
technology choices

The mainstream  
telecommunications  
industry has a  
rich history

...of making very poor  
technology guesses

and regularly being  
taken by  
surprise!

So, how are we going with the IPv4 to IPv6 transition?

Do we really need to worry about  
this?

Do we really need to worry about this?

Surely IPv6 will just happen — its just a matter of waiting for the pressure of IPv4 address exhaustion to get to sufficient levels of intensity.

Do we really need to worry about this?

Surely IPv6 will just happen — its just a matter of waiting for the pressure of IPv4 address exhaustion to get to sufficient levels of intensity.

Or maybe not — let's look a bit closer at the situation ...

The  
"inevitability"  
of technological  
evolution

wires

The  
"inevitability"  
of technological  
evolution

wires

virtual  
circuits

Well what did you expect? They are VIRTUAL circuits, so a picture was always going to be a challenge!

The  
"inevitability"  
of technological  
evolution

The  
"inevitability"  
of technological  
evolution

Now lets look at something a little  
more topical to today!

The  
"inevitability"  
of technological  
evolution?

IPv4

The  
"inevitability"  
of technological  
evolution?

The challenge often  
lies in managing the  
transition from one  
technology to another

The challenge often lies in managing the transition from one technology to another

To get from "here" to "there" requires an excursion through an environment of CGNs, CDNs, ALGs and similar middleware 'solutions' to IPv4 address exhaustion

The challenge often lies in managing the transition from one technology to another

To get from "here" to "there" requires an excursion through an environment of CGNs, CDNs, ALGs and similar middleware 'solutions' to IPv4 address exhaustion

But will this be merely a temporary phase of transition?

Transition requires the network owner to undertake capital investment in network service infrastructure to support IPv4 address sharing/rationing.

But will this be merely a temporary phase of transition?

Transition requires the network owner to undertake capital investment in network service infrastructure to support IPv4 address sharing/rationing.

What lengths will the network owner then go to to protect the value of this additional investment by locking itself into this "transitional" service model for an extended/indefinite period?

The challenge often lies in managing the transition from one technology to another

The risk in this transition phase is that the Internet heads off in a completely different direction!

How can we "manage" this transition?

How can we "manage" this transition?

To ensure that the industry maintains a collective focus on IPv6 as the objective of this exercise!

How can we "manage" this transition?

To ensure that the industry maintains a collective focus on IPv6 as the objective of this exercise!

And to ensure that we do not get distracted by attempting to optimize what were intended to be temporary measures

How can we "manage" this transition?

This was always going to be a very hard question to try and answer!

And the data on IPv6 uptake so far suggests that we are still not managing this at all well. Progress at the customer edge of the network with IPv6 access is glacial.

How can we "manage" this transition?

This was always going to be a very hard question to try and answer!

And at the moment we seem to be making the task even harder, not easier, by adding even more challenges into the path we need to follow!

# Challenges:

1. This is a deregulated and highly competitive environment

# Challenges:

1. This is a deregulated and highly competitive environment

It is NOT a case of a single  
"either/or" decision

# Challenges:

1. This is a deregulated and highly competitive environment

There are many different players  
Each with their own perspective

# Challenges:

1. This is a deregulated and highly competitive environment

There are many different players  
Each with their own perspective

And all potential approaches will be explored!

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan!

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan, just the interplay of various market pressures

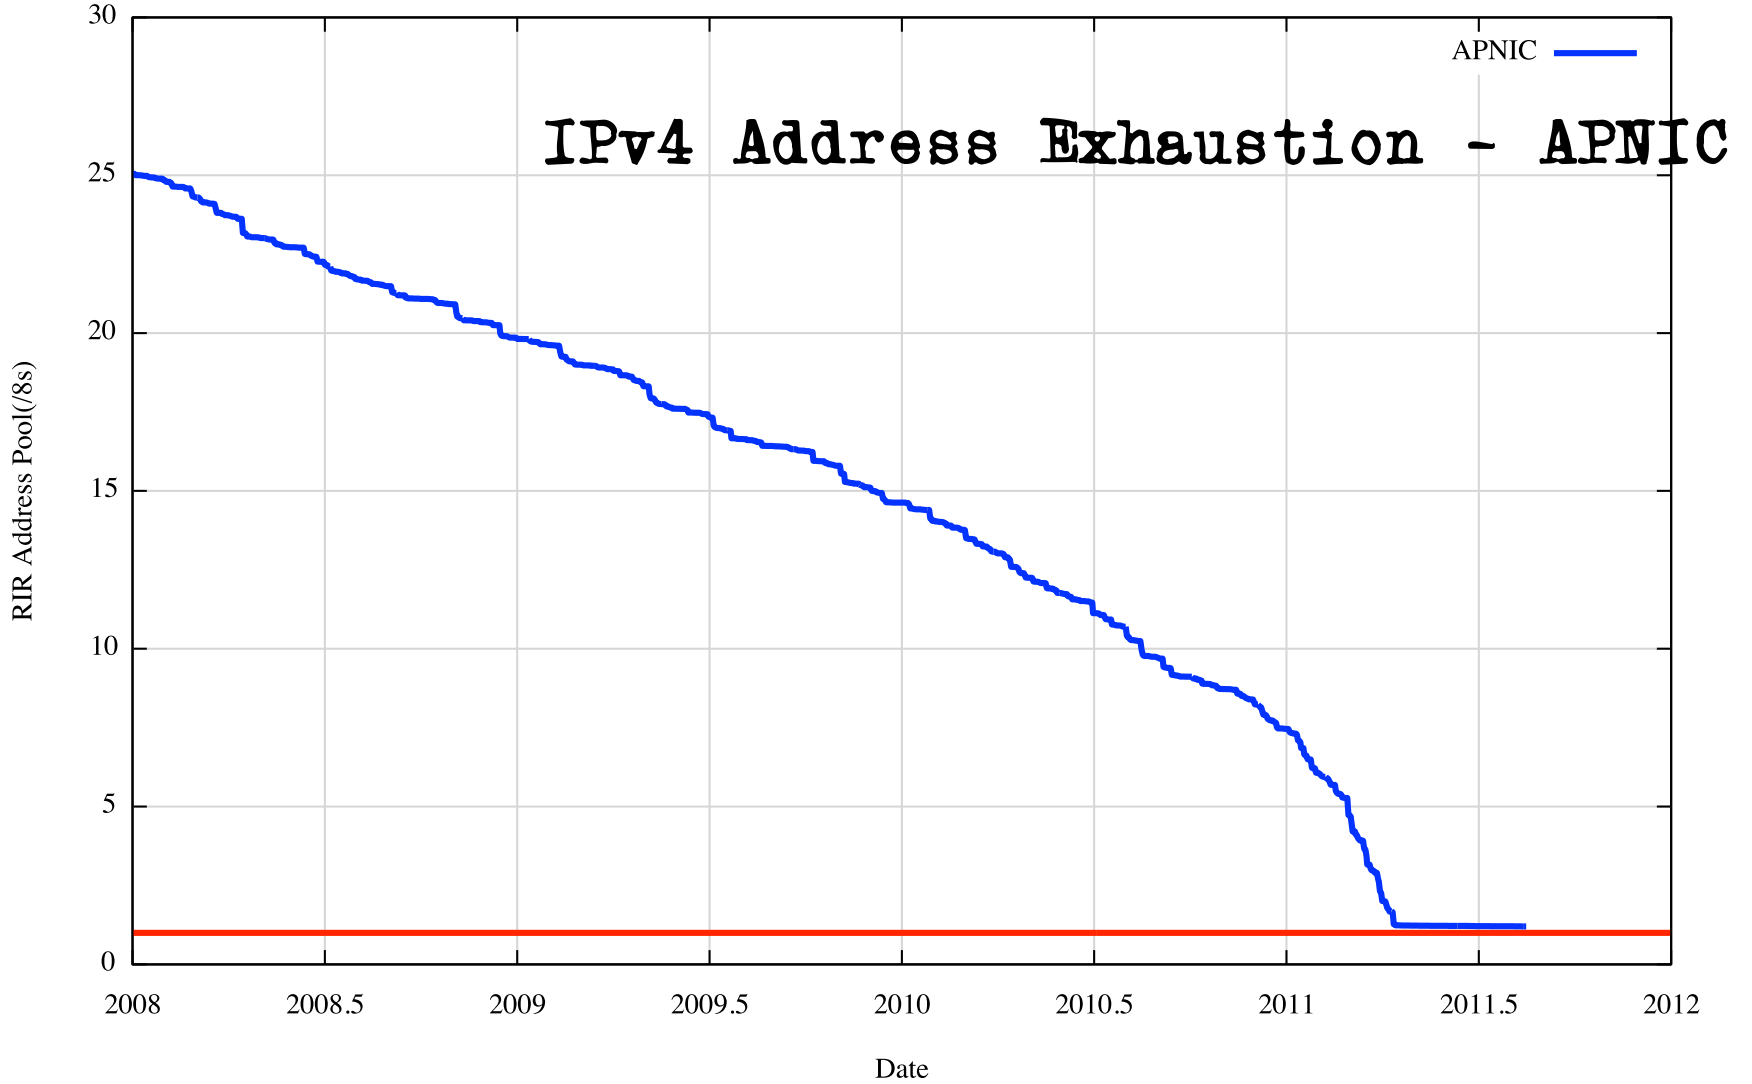

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan, just the interplay of various market pressures

2. Varying IPv4 Address Exhaustion Timelines

RIR IPv4 Address Run-Down Model

RIR IPv4 Address Run-Down Model

RIR IPv4 Address Run-Down Model

# Exhaustion Predictions

RIR	Predicted Exhaustion Date *	Remaining Address Pool (2 Oct 2011)
APNIC	19 April 2011 (actual)	1.20 /8s (0.3 /8s rsvd)
RIPE NCC	9 June 2012	3.91 /8s
LACNIC	1 March 2014	4.27 /8s
AFRINIC	28 May 2014	4.38 /8s
ARIN	9 Oct 2014	5.91 /8s

*\* Here "exhaustion" is defined as the point when the RIR's remaining pool falls to 1 /8*

RIR IPv4 Address Run-Down Model - Variance Analysis

**So what?**

# Reality Acceptance

# Reality Acceptance

Or not

# Reality Acceptance

Or not

Is IPv4 address exhaustion a "here and now" problem or a "some time in the future" problem?

# Reality Acceptance

Or not

Is IPv4 address exhaustion a "here and now" problem or a "some time in the future" problem?

Well, that depends on where you happen to be!  
If it hasn't happened to you yet, then denial is still an option!

# Reality Acceptance

Or not

Is IPv4 address exhaustion a "here and now" problem or a "some time in the future" problem?

*It's not happening until its happening to me!*

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan, just the interplay of various market pressures

2. Varying IPv4 Address Exhaustion Timelines

There is a credibility problem!

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan, just the interplay of various market pressures

2. Varying IPv4 Address Exhaustion Timelines

There is a credibility problem: This industry has a hard time believing reality over its own mythology

# Challenges:

1. This is a deregulated and highly competitive environment

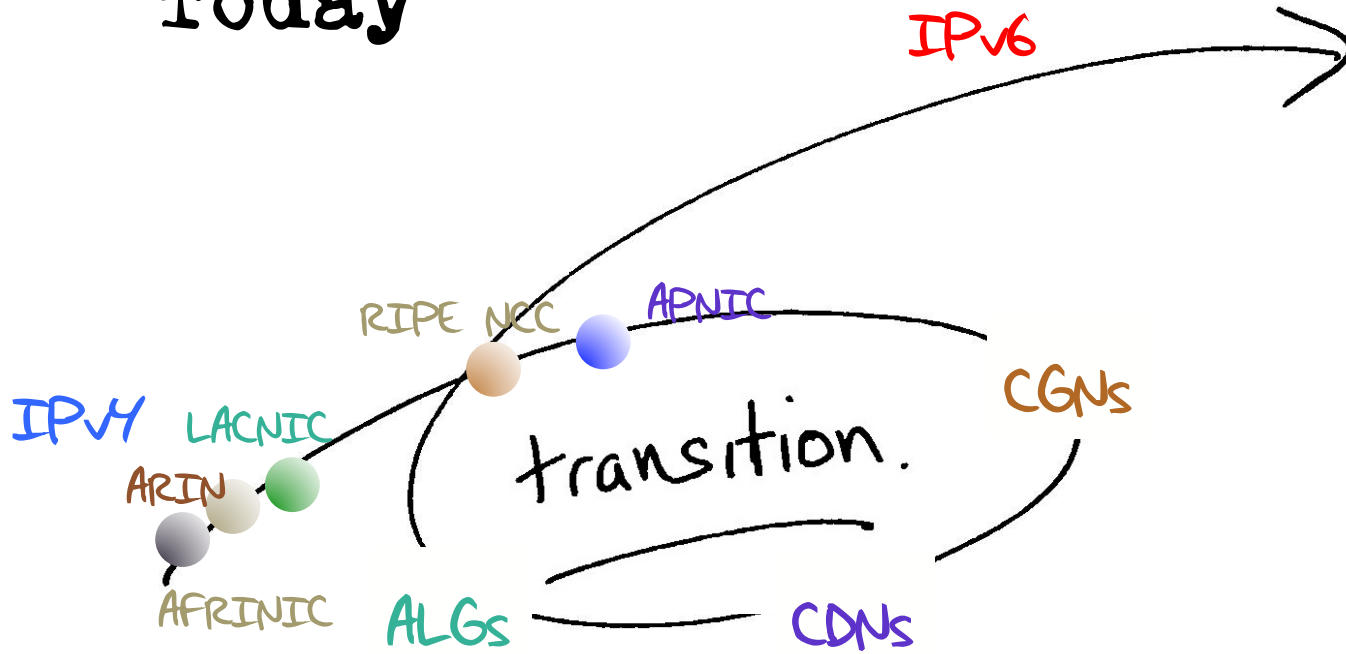

There is no plan, just the interplay of various market pressures

2. Varying IPv4 Address Exhaustion Timelines

There is a credibility problem: This industry has a hard time believing reality over its own mythology

3. Regional Diversity

Today

Mid 2012

IPv6

2013

By 2013 it is possible that different regions of the world will be experiencing very different market pressures for the provision of Internet services, due to differing transitional pressures from IPv4 exhaustion

By 2013 it is possible that different regions of the world will be experiencing very different market pressures for the provision of Internet services, due to differing transitional pressures from IPv4 exhaustion

What's the level of risk that the differing environments of transition lead to significantly different outcomes in each region?

By 2013 it is possible that different regions of the world will be experiencing very different market pressures for the provision of Internet services, due to differing transitional pressures from IPv4 exhaustion

Will we continue to maintain coherency of a single Internet through this transition?

What's the level of risk that the differing environments of transition lead to significantly different outcomes in each region?

# The Myth of the Long Term Plan

# The Myth of the Long Term Plan

"Transition will take many years...

5 years, maybe 10 years, maybe longer"

# The Myth of the Long Term Plan

"Transition will take many years...

5 years, maybe 10 years, maybe longer"

Are we still firmly committed to the plans we had 5 years ago?

# The Myth of the Long Term Plan

“Transition will take many years...

5 years, maybe 10 years, maybe longer”

Are we still firmly committed to the plans we had 5 years ago?

How about our 10 year old plans?

# The Myth of the Long Term Plan

“Transition will take many years...

5 years, maybe 10 years, maybe longer”

Are we still committed to the plans we had 5 years ago? How about our 10 year old plans?

The longer the period of transition, the higher the risk of completely losing the plot and heading into other directions!

201x?

2. Varying IPv4 Address Exhaustion Timelines

There is a credibility problem: This industry has a hard time believing reality over its own mythology

3. Regional Diversity

One network is not an assured outcome!

# Challenges:

1. This is a deregulated and highly competitive environment

There is no plan, just the interplay of various market pressures

2. Varying IPv4 Address Exhaustion Timelines

There is a credibility problem: This industry has a hard time believing reality over its own mythology

3. Regional Diversity

One network is not an assured outcome: Market pressures during an extended transition may push the Internet along different paths in each region

If IPv6 is what we are after as an open and accessible platform for further network growth and innovation then the public interest in a continuing open and accessible network needs to be expressed within the dynamics of market pressures.

Today's question is:

How can we do this?

How can we help the  
Internet through this  
transition?

How can we help the  
Internet through this  
transition?

Or at least, how can we avoid making it any  
worse than it is now?

Yes, that was intentionally left blank!

I really don't know what will work,

And as far as I can see, nor does  
anyone else!

But even though I don't have an answer here, I have some thoughts to offer about this issue of pulling the Internet through this transition

Three thoughts...

# Firstly

If we want one working Internet at the end of all this, then keep an eye on the larger picture

Think about what is our common interest here

and try to find ways for local interests to converge with our common interest in a single cohesive network that remains open, neutral, and accessible

# Secondly

**Addresses should be used in working networks, not hoarded**

Scarcity generates pain and uncertainty

Hoarding exacerbates scarcity in both its intensity and duration

Extended scarcity prolongs the pain and increases the unpredictability of the entire transition process

# Finally...

**Bring it on! A rapid onset of exhaustion and a rapid transition represents the best chance of achieving an IPv6 network as an outcome**

The more time we spend investing time, money and effort in deploying IPv4 address extension mechanisms, the greater the pain to our customers, and the higher the risk that we will lose track of the intended temporary nature of transition and the greater the chances that we will forget about IPv6 as the objective!

Thank You!

Of course, there is  
another perspective on  
this transition to  
IPv6...

# IPv4 as a Strategy

or how address shortage will provide  
control over services again

# Consultants

Because Meat and Malbec is simply not enough

# Services generate value

- Users do not care about the network, they care about services
  - voice, games, music, movies, and other entertainment
  - self-ordering fridges, automotive intelligence, and other device2device or device2human interaction

# Prior to the Internet

- Telecom operators provided the services and controlled the value chain and its revenue
  - high stability, high margins, stockholder value
  - successful innovations: telephony, fax, minitel, 800 and 900 number based services

# Internet is a virus?!

- Internet caught us by surprise:
  - Customers connected to Internet Service Providers via modems over telephony infrastructure
  - Applications where offered without our permission
- Turned the intelligent telephony network into a dumb transport service

# Connectivity vs. Service

- Providing television, internet and voice over the same infrastructure provides some value added revenue
- But content is provided more and more by Internet Services
  - Telephony moves to voip (Skype)
  - Television moves to YouTube

# Why did this work?

- The open end-to-end model:
  - Network Layer and Application Layer evolved independently
  - Connected devices could interact without changes to the network

# Breaking Openness

- Internet depended on the endless supply of free IP addresses
- Resources are not free:
  - People did not pay for additional addresses
  - rational economic behavior forces intelligence towards the core
- Imagine what we could have done when we had monetized on NATs from the start

# Why is IPv4 Shortage Good For Us?

- Allows us to introduce an additional control point through which we can gain control over the services
  - End user hosts will not be able to connect to the Internet directly
- Technology called Carrier Grade NAT (CGN)

10 Apps  
per device

15 devices  
per customer

100 Customers  
per ext. address

65535 port  
per ext. app-address

Homenet

CPE-NAT

Access Net

CGN

Application  
Service  
Providers

Internet

Service  
Experience

# Properties of Carrier NAT Architecture

- Turns one limited resource (addresses) into another (ports)
- We can relate the number of ports a customer has available to services
- Results in the possibility of tiered services and variable billing

**Partner Service Platform**

**Internet Platform**

**unencumbered view**

**CGN**

**Experience limited because of global resource limits**

# In addition

- Some services are extremely difficult to operate over NAT. e.g.:
  - Voice over IP (SKYPE)
  - Bit Torrent
  - Running services

# The result

- Incentive for Application Service Providers to partner with us
  - Guaranteed Quality of Service
  - Revenue sharing to keep CGN and network up to par with their needs

# Risks

- Potential Regulatory Pressure
  - IPv4 for new entrants
  - Net Neutrality
  - IPv6 'as public good'

# IPv4 and new entrants

- IPv4 is a scarce resource: 2012 no IPv4 available from the RIRs
  - Market Entrance is a regulatory concern
- We will return IPv4 addresses
  - Goodwill with regulators
  - We'll be moving to CGNs anyway

# Net Neutrality

- The CGN based architecture cannot be neutral any longer because the address-scarcity cannot be fixed by investments or market competition
  - External services move inside our network
  - or only have limited ports: bad user experience

# IPv6 trials

- Offering IPv6 leads to failure:
  - No application and CPE support
  - Worse user experience: customers will allow us to stay conservative and slowly move to CNGs
- Expensive to participate in
  - But a demonstration of good will

# Conclusion

- IPv4 based CGNs to cope with address exhaustion as a positive long term incentive
- CGNs will allow us to generate revenue from services again

Thank You!

Consultants

*Because Meat and Malbec is simply not enough*
